CSEE&T 2011 - 24 May 2011

#### Motivation

royiding useful feedback on Java programming assignments is hard

★ the more time we spend evaluating/ critiquing style, language usage, design consistency, and logical correctness, the less we can spend on higher-level design and algorithmic issues

# Static Checking

\* many assignment components can be statically checked with existing tools

- CheckStyle/FindBugs/PMD/Metrics for style, language usage, "bug patterns", complexity, ...
- \* BONc for consistency between high level design and implementation
- \* ESC/Java2 for logical correctness of formally specified code

#### AutoGradeMe

Eclipse plug-in integrated into development environment provided to students, tunable by instructors

\* uses output of existing static checkers to compute grades for parts of assignments that can be checked automatically

provides students continuous feedback on the quality of their code (with respect to all the issues previously mentioned)

#### AutoGradeMe

typical usage: x% of this assignment's grade is taken directly from your AutoGradeMe score

- ★ this can include automatic evaluation of design consistency and correctness with respect to formal specification – potentially a large fraction of the assignment
- ★ students know exactly what they will get for that fraction of the assignment when they turn it in – **no surprises**

### The Present

\* incorporates output from all the plugins previously mentioned

\* available publicly, including source and an Eclipse update site, for about 2 years: <u>http://www.kindsoftware.com/products/</u> <u>opensource/AutoGrader/</u>

\* used in several courses at UW Tacoma and ITU Copenhagen

### The Future

- \* extensibility instructors can add any plugins they want to the mix
- integration of automated unit testing
  (JUnit, TestNG)
  - \* evaluation of unit test coverage/results for student-written tests

\* evaluation of results for instructorprovided tests and (when available) automatically-generated tests
